Variables

Variables

- when you are *defining* a program, such as a stored procedure for instance, you can say you are using ‘*parameters*’

Variables

- when you are *defining* a program, such as a stored procedure for instance, you can say you are using *'parameters'*

  - *'parameters'* are a more abstract term

Variables

- when you are *defining* a program, such as a stored procedure for instance, you can say you are using *'parameters'*

  - *'parameters'* are a more abstract term

SQL

```
DELIMITER $$
CREATE PROCEDURE procedure_name (in                    , out                    )
```

Variables

  - *'parameters'* are a more abstract term

SQL

```
DELIMITER $$
CREATE PROCEDURE procedure_name (in parameter, out                )
```

Variables

- when you are *defining* a program, such as a stored procedure for instance, you can say you are using *'parameters'*
  - *'parameters'* are a more abstract term

SQL

```
DELIMITER $$
CREATE PROCEDURE procedure_name (in parameter, out parameter)
```

Variables

- once the structure has been solidified, then it will be applied to the database. The input value you insert is typically referred to as the *‘argument’*, while the obtained output value is stored in a *‘variable’*

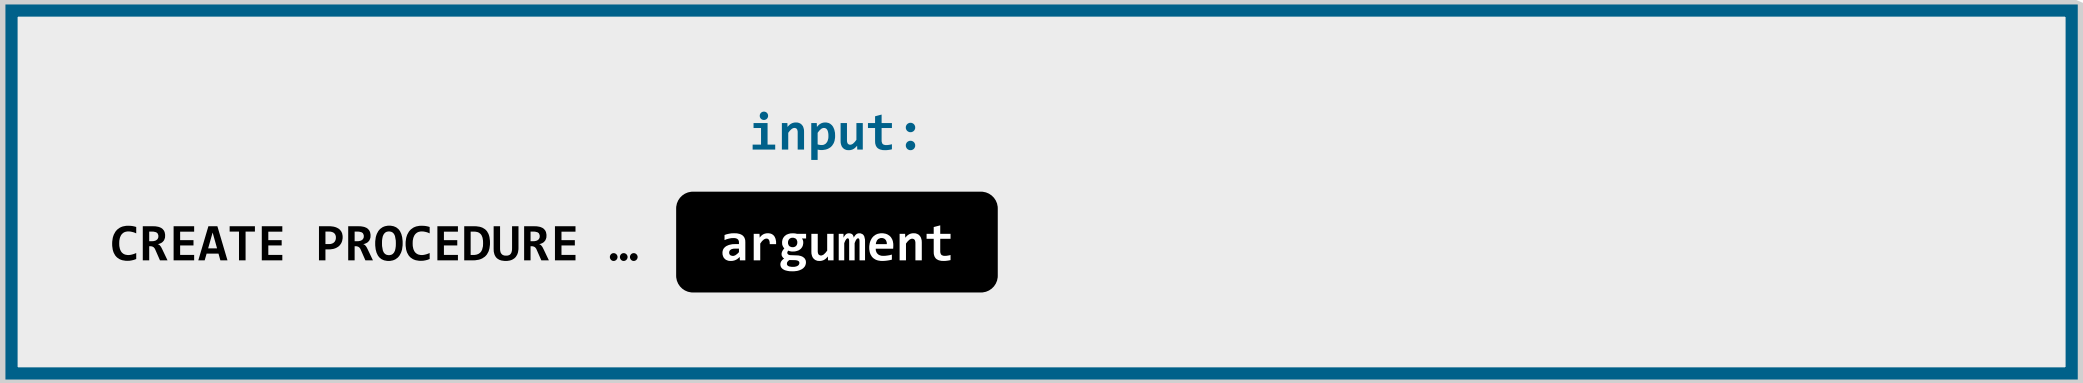
Variables

- once the structure has been solidified, then it will be applied to the database. The input value you insert is typically referred to as the *‘argument’*, while the obtained output value is stored in a *‘variable’*

```
CREATE PROCEDURE …
```

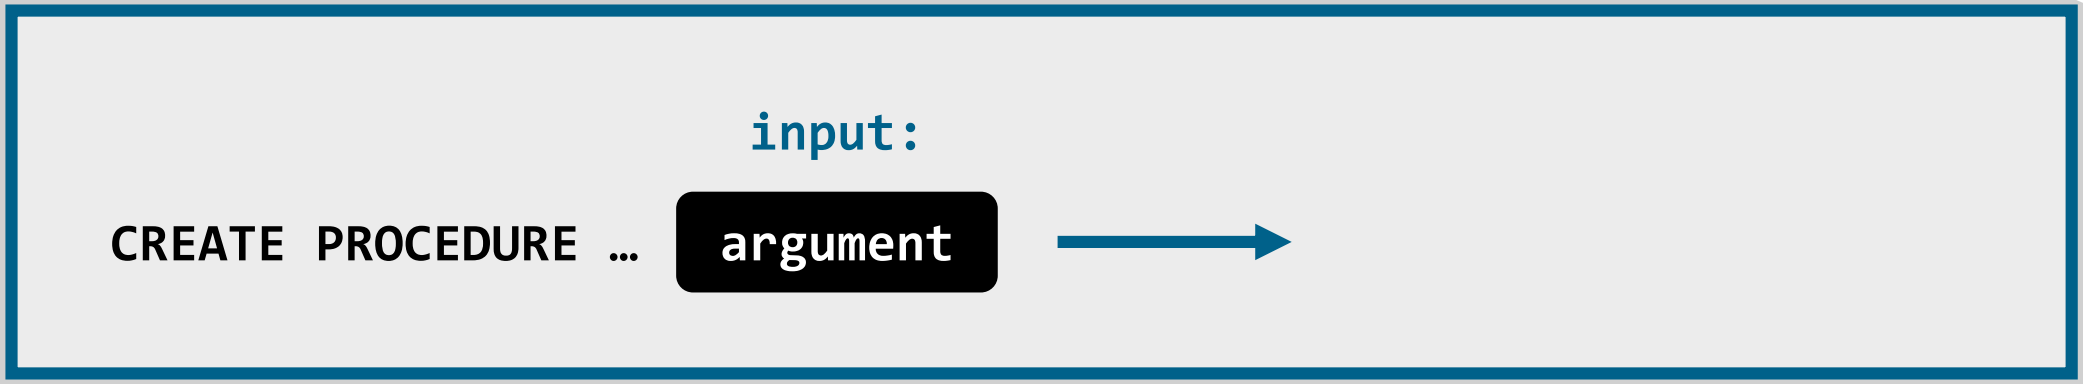
Variables

once the structure has been solidified, then it will be applied to the database. The input value you insert is typically referred to as the *'argument'*, while the obtained output value is stored in a *'variable'*



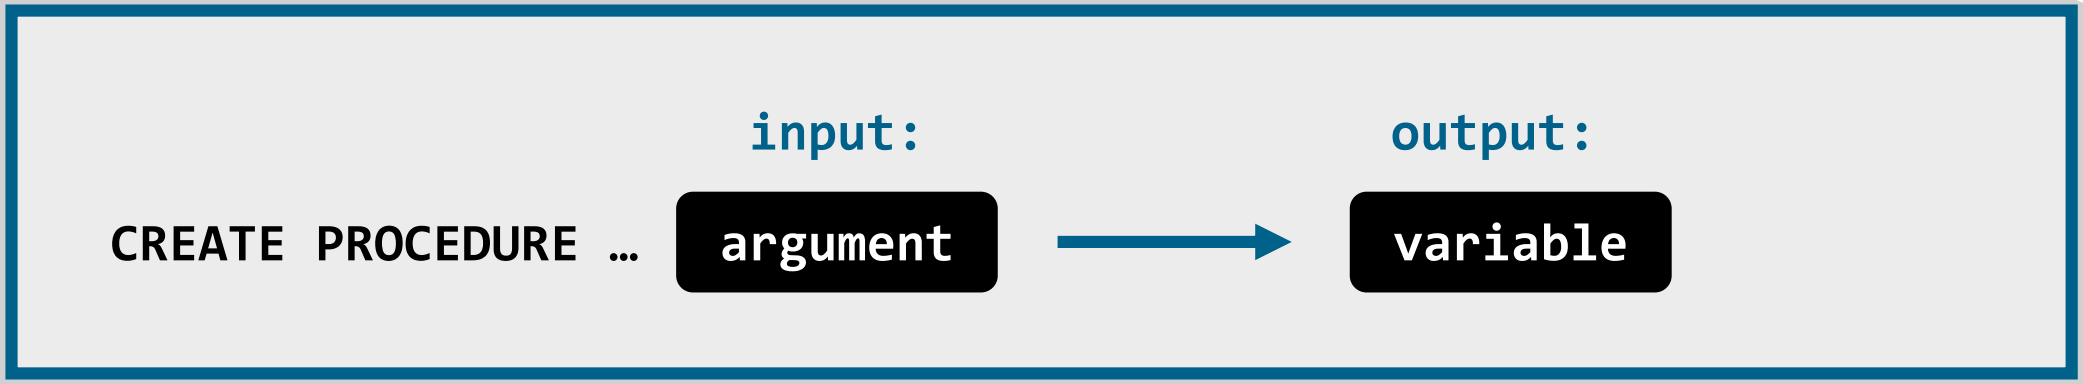
Variables

once the structure has been solidified, then it will be applied to the database. The input value you insert is typically referred to as the *'argument'*, while the obtained output value is stored in a *'variable'*



Variables

once the structure has been solidified, then it will be applied to the database. The input value you insert is typically referred to as the *'argument'*, while the obtained output value is stored in a *'variable'*



Variables

SQL

```
DELIMITER $$
CREATE PROCEDURE procedure_name (in parameter, out parameter)
```

≠

Variables

- IN-OUT parameters

```
CREATE PROCEDURE …
```

Variables

- IN-OUT parameters

```
CREATE PROCEDURE …
```
